Abstracts

Flocculation and coagulation is a chemical cleaning treatment for the waste water generally undertaken before the sedimentation process thus aiding in enhancing the process to remove particles from the water. Coagulant chemical of positive electrical charge on addition neutralizes the negative electrical charges on the particles thus disrupts the forces which keeps collides apart. Flocculant chemicals agglomerate the neutral charge solids thus making them to settle which can further be filtered. The flocculation chemicals are of two type's namely cationic flocculants and anionic flocculants whereas the coagulation chemicals includes organic coagulants, inorganic coagulants and mix of them. In organic coagulants polyamine and polyDADMAC are the most widely used coagulants in water treatment process. The global flocculation and coagulation market is expected to grow during the forecast period with the growth of end use industries.

This report elaborates the market size, market characteristics, and market growth of the Flocculant And Coagulant industry, and breaks down according to the type, application, and consumption area of Flocculant And Coagulant. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
