## **Abstracts**

Food allergens are mainly proteins that the immune system of allergic individuals mistakenly believes are harmful. Food allergies are typically IgE-mediated, which means that the body produces large amounts of antibodies that specifically target the proteins of certain food products. When these antibodies bind to an allergen, they trigger an allergic reaction, which may range from mild symptoms to a life-threatening anaphylactic shock. Sometimes also non-IgE-mediated immune reactions with a delayed onset after ingestion are possible. As food allergens represent an ever-present risk for individuals with allergies, it is critical for food producers to conduct routine tests for potential allergen contaminations in their products.

This report elaborates the market size, market characteristics, and market growth of the Food Allergen Testing industry, and breaks down according to the type, application, and consumption area of Food Allergen Testing. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Food Allergen Testing in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
