Abstracts

The casting process involves heating the metal until it melts and then pouring it into a mold to form a specific shape. This process is useful when the shape of the part is complex or the part requires very large dimensions. Another advantage of castings is that processing costs can sometimes be reduced because components can be manufactured to certain specifications.

Forging is a technique where the metal is first heated, then hammered and manipulated into the final desired shape. Forgings are generally stronger than castings, but there are some restrictions on the manufacturing capabilities of forgings. The parts must not be too complicated or too complicated during forging. Generally, if a part needs to be forged and also meets certain dimensional requirements, it needs to be machined after the part is produced.

This report elaborates the market size, market characteristics, and market growth of the Forging and Casting industry, and breaks down according to the type, application, and consumption area of Forging and Casting. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Forging and Casting in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
