Abstracts

Formwork is the general term given to the mould into which concrete is poured. It is generally made of timber or steel, the surface in contact with the concrete being selected to give the required finish. The strength of the formwork and its associated falsework must be sufficient to support the weight of the wet concrete without significant distortion. Formwork is generally removed once the concrete has gained sufficient strength though in some circumstances it may be left in place (permanent formwork). Although timber and steel are the materials most commonly used for formwork, a range of other materials are used, mainly for specialist applications.

This report elaborates the market size, market characteristics, and market growth of the Formwork industry, and breaks down according to the type, application, and consumption area of Formwork. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Formwork in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
