## Abstracts

A galvanometer is an electromechanical instrument used for detecting and indicating electric current. A galvanometer works as an actuator, by producing a rotary deflection (of a 'pointer'), in response to electric current flowing through a coil in a constant magnetic field. Early galvanometers were not calibrated, but their later developments were used as measuring instruments, called ammeters, to measure the current flowing through an electric circuit.

This report elaborates the market size, market characteristics, and market growth of the Galvanometers industry, and breaks down according to the type, application, and consumption area of Galvanometers. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Galvanometers in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
