Abstracts

A gear pump is a rotary pump that relies on the change and movement of the working volume formed between the pump cylinder and the meshing gear to deliver or pressurize the liquid. The two gears, the pump body and the front and rear covers form two closed spaces. When the gear rotates, the volume of the space on the side of the gear disengagement increases from small to large, forming a vacuum, sucking the liquid, and the volume of the space on the gear meshing side changes from large to small, and squeeze the liquid into the pipeline. The suction chamber and the discharge chamber are separated by the meshing lines of the two gears. The pressure at the discharge port of the gear pump is completely dependent on the resistance at the pump outlet.

This report elaborates the market size, market characteristics, and market growth of the Gear Pumps industry, and breaks down according to the type, application, and consumption area of Gear Pumps. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
