Abstracts

Geogrid is a geo-synthetic material formed by joining intersecting ribs and is used to stabilize terrain. Geogrids are mainly made up of polymers such as polypropylene, high-density polyethylene, and polyester. They are used as a base reinforcement, to reinforce retaining walls, and subsoils below roads or structures. These are available in three types: homogeneous-type geogrid, textile-like geogrid, and laser-made geogrid. The digging up of sub-grade from other area and then filling up the required area with that soil is a very time taking and expensive practice. Geogrids are used as a replacement material for this practice. Its remarkable property, such as minimal elongation with high tensile strength and tensile modulus makes it applicable to be used as a reinforcement material.

This report elaborates the market size, market characteristics, and market growth of the Geogrids industry, and breaks down according to the type, application, and consumption area of Geogrids. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Geogrids in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
