Abstracts

The glass tempering furnace uses physical or chemical methods to form a compressive stress layer on the surface of the glass and forms a tensile stress layer inside; when the glass is subjected to an external force, the compressive stress layer can cancel part of the tensile stress to avoid glass cracking, thereby increasing the strength of the glass. This report elaborates the market size, market characteristics, and market growth of the Glass Tempering Furnace industry, and breaks down according to the type, application, and consumption area of Glass Tempering Furnace. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
