Abstracts

Heat cost allocator, denoting devices attached to individual radiators in buildings that measure the total heat output of the individual radiator, which available with electronic and evaporative types. Electric heat cost allocators were where one or two electronic thermo-sensors and a microcontroller are used to calculate the heat consumption of radiator by the temperature difference between the radiator and the air in a room. Evaporating style heat cost allocators were where a special, calibrated liquid in a capillary tube records the total heat absorbed from the air in addition to that output by the radiator.

This report elaborates the market size, market characteristics, and market growth of the Heat Cost Allocator industry, and breaks down according to the type, application, and consumption area of Heat Cost Allocator. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Heat Cost Allocator in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
