Abstracts

Heat Shrink Tubing can be made of any one of a range of thermoplastics, including polyolefin, polyvinyl chloride (PVC), Viton (for high-temp and corrosive environments), Neoprene, polytetrafluoroethylene (PTFE), fluorinated ethylene propylene (FEP) and Kynar. In addition to these polymers, some types of special-application heat shrink can also include an adhesive lining that helps to bond the tubing to underlying cables and connectors, forming strong seals that can often be waterproof. Another material that is sometimes added to heat shrink tubing is conductive polymer thick film, which provides an electrical connection between the two or more conductive objects that are being joined by the tubing – without the need to solder them first.

This report elaborates the market size, market characteristics, and market growth of the Heat-Shrinkable Tubing industry, and breaks down according to the type, application, and consumption area of Heat-Shrinkable Tubing. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Heat-Shrinkable Tubing in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
