Abstracts

In the financial market, High Frequency Trading (HFT) is an algorithmic transaction characterized by high speed, high turnover and high order trading ratios, using high frequency financial data and electronic trading tools. Although there is no single HFT definition, its key attributes include highly complex algorithms, co-location and very short-term investment horizons. HFT can be seen as the main form of financial algorithmic trading. Specifically, it uses advanced technology tools and computer algorithms to quickly trade securities. HFT uses a proprietary trading strategy run by a computer to enter and exit positions in seconds or fractions of a second.

This report elaborates the market size, market characteristics, and market growth of the High-frequency Trading industry, and breaks down according to the type, application, and consumption area of High-frequency Trading. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for High-frequency Trading in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
