Abstracts

The holographic film is a very thin flexible plastic film [polyester (PET), oriented polypropylene (OPP) and nylon (Bonyl)], which has been micro-embossed and even images. Patterns (eg, grid plates or diamonds) or images (eg, tigers) are produced by embossing processes that provide significant 3-D effects and/or spectral (rainbow) colouration. The embossing process is similar to cutting tiny grooves into the film surface at various angles and shapes. These micro-embossed grooves make the 'diffraction' of normal white light an amazing spectral colour. This phenomenon is no different from the diffraction of white light into a spectral colour by a crystal prism. This report elaborates the market size, market characteristics, and market growth of the Holographic Lamination Film industry, and breaks down according to the type, application, and consumption area of Holographic Lamination Film. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Holographic Lamination Film in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
