Abstracts

Hormone replacement therapy (HRT), also known as menopausal hormone therapy (MHT) or postmenopausal hormone therapy (PHT, PMHT), is a form of hormone therapy which is used to treat symptoms associated with menopause in women. These symptoms can include hot flashes, vaginal atrophy and dryness, and bone loss, among others, and are caused by diminished levels of sex hormones in the menopausal period. The main hormonal medications used in HRT for menopausal symptoms are estrogens and progestogens. A progestogen is usually used in combination with an estrogen in women with intact uteruses because unopposed estrogen therapy is associated with endometrial hyperplasia and cancer and progestogens prevent these risks. Androgens like testosterone are sometimes used in HRT as well. HRT medications are available in various forms and for use by a variety of different routes of administration.

This report elaborates the market size, market characteristics, and market growth of the Hormone Replacement Therapy (HRT) industry, and breaks down according to the type, application, and consumption area of Hormone Replacement Therapy (HRT). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
