Abstracts

An inductor is a passive two-terminal electrical component. It is made of an electrical conductor for example, a wire, normally wound into a coil. A current flowing through it will store energy temporarily in a magnetic field in the coil. If the current flowing through changes, this creates a voltage.

A transformer consists of two coils of insulated wire. In most transformers, the wires are wound around an iron-containing structure called the core. One coil (the primary), is connected to an input source of alternating current that produces a constantly varying magnetic field around the coil. This in turn, produces an alternating current in the other coil. This coil (the secondary), is connected to a separate electric circuit, to give an output.

This report elaborates the market size, market characteristics, and market growth of the Inductor and Transformer industry, and breaks down according to the type, application, and consumption area of Inductor and Transformer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Inductor and Transformer in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
