Abstracts

Inorganic flame retardant is composed of a high temperature resistant solution added to the ultrafine inorganic metal oxide for fine processing. The inorganic flame retardant mainly adds the inorganic element having intrinsic flame retardancy to the flame-retardant substrate in the form of a simple substance or a compound, and is sufficiently mixed with the polymer in a physically dispersed state, and passes through the chemical or the gas phase or the condensed phase. Physical changes play a flame retardant role.

This report elaborates the market size, market characteristics, and market growth of the Inorganic Flame Retardants industry, and breaks down according to the type, application, and consumption area of Inorganic Flame Retardants. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Inorganic Flame Retardants in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
