Abstracts

An ionomer is a polymer comprising repeating units of two electrically neutral repeating units and a portion of an ionizing unit (typically no more than 15 mole %) covalently bonded to the polymer backbone as pendant moieties. This means that most ionomers are copolymers of neutral and ionized units, which usually consist of carboxylic acid groups. The classification of a polymer as an ionomer depends on the level of substitution of the ionic group and how the ionic group is incorporated into the polymer structure.

This report elaborates the market size, market characteristics, and market growth of the ionomer industry, and breaks down according to the type, application, and consumption area of ionomer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for ionomer in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
