Abstracts

Ionones are cyclocitrylidene acetones with the molecular formula C₁₃H₂₀O. They are an important and versatile class of aroma chemicals. They exist in two forms: alpha and B forms. Ionones are generally found in the form of a colorless to pale-yellow colored liquid and have a molecular weight of 192.3. Ionones and methyl ionones were discovered in 1893 by Tiemann, a German scientist, while investigating the compounds responsible for the fragrance of violets. This discovery changed the nature of the perfume industry, as it demonstrated that synthetic aroma chemicals could be used in fragrance formulations that until then relied exclusively on natural products. In the contemporary perfume industry, ionones and methyl ionones along with their derivatives such as iso E super, irones, koavone, timberol, and damascones are used in virtually all commercial fragrances. The ionones scent ranges from violets to a scent of soft wood mixed with violet tones.

This report elaborates the market size, market characteristics, and market growth of the ionone industry, and breaks down according to the type, application, and consumption area of ionone. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for ionone in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
