Abstracts

Laser plastic welding, also often referred to as through-transmission welding, is a process of bonding plastic using focused laser radiation. The process is very much different than traditional metal welding. The concept involves passing a focused laser beam through an upper, laser transmissive part to the interface of the two parts to be joined. The laser light is turned into heat energy as it is absorbed by the lower joining partner. The heat created at the interface creates a molten weld seam and the two plastics are fused.

This report elaborates the market size, market characteristics, and market growth of the Laser Plastic Welding industry, and breaks down according to the type, application, and consumption area of Laser Plastic Welding. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Laser Plastic Welding in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
