## Abstracts

A light-emitting diode (LED) is a two-lead semiconductor light source. It is a p–n junction diode that emits light when activated. When a suitable current is applied to the leads, electrons are able to recombine with electron holes within the device, releasing energy in the form of photons. This effect is called electroluminescence, and the colour of the light is determined by the energy band gap of the semiconductor. LEDs are typically small and integrated optical components may be used to shape the radiation pattern.

This report elaborates the market size, market characteristics, and market growth of the Light Emitting Diodes Lighting Equipments industry, and breaks down according to the type, application, and consumption area of Light Emitting Diodes Lighting Equipments. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
