Abstracts

Lithium is a chemical element with symbol Li and atomic number 3. It is a soft, silvery-white alkali metal. Under standard conditions, it is the lightest metal and the lightest solid element. Like all alkali metals, lithium is highly reactive and flammable, and is stored in mineral oil. When cut, it exhibits a metallic luster, but moist air corrodes it quickly to a dull silvery gray, then black tarnish. It never occurs freely in nature, but only in (usually ionic) compounds, such as pegmatitic minerals which were once the main source of lithium. Due to its solubility as an ion, it is present in ocean water and is commonly obtained from brines. Lithium metal is isolated electrolytically from a mixture of lithium chloride and potassium chloride.

Lithium is one of the most important metals of the 21st century. It makes possible the rechargeable battery technology found in mobile phones, laptops, and electric vehicles. There are two main sources of lithium: mines and brine water. Most of the world's lithium (87 percent) comes from the latter source.

This report elaborates the market size, market characteristics, and market growth of the Lithium Mining industry, and breaks down according to the type, application, and consumption area of Lithium Mining. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Lithium Mining in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
