Abstracts

A load balancer is a device that acts as a reverse proxy and distributes network or application traffic across a number of servers. Load balancers are used to increase capacity (concurrent users) and reliability of applications. They improve the overall performance of applications by decreasing the burden on servers associated with managing and maintaining application and network sessions, as well as by performing application-specific tasks.

This report elaborates the market size, market characteristics, and market growth of the Load Balancer industry, and breaks down according to the type, application, and consumption area of Load Balancer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Load Balancer in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
