Abstracts

Metamaterial Medium is defined as a macroscopic composite having a man-made, three dimensional, and periodic cellular architecture designed to produce an optimized combination, not available in nature, of two or more responses to a specific excitation. It possesses exceptional physical properties such as negative permeability and permittivity, and is often regarded as artificial medium with negative refractive index. The most efficient metamaterial medium possesses zero permeability and permittivity, and thus are best used to manufacture antennas to achieve high directivity. A metamaterial medium provides super-resolution in the far-field across image magnification, negative refraction of wavelengths, and enhanced spontaneous emission. Negative index metamaterial medium is an effective medium since it is made up of ordered macroscopic material, generally synthesized from the bottom up and yields emergent properties beyond its components as a single entity.

This report elaborates the market size, market characteristics, and market growth of the Metamaterial Medium industry, and breaks down according to the type, application, and consumption area of Metamaterial Medium. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Metamaterial Medium in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
