Abstracts

Microcontact printing (or μ CP) is a form of soft lithography that uses the relief patterns on a master polydimethylsiloxane (PDMS) stamp to form patterns of self-assembled monolayers (SAMs) of ink on the surface of a substrate through conformal contact as in the case of nanotransfer printing (nTP). Its applications are wide-ranging including microelectronics, surface chemistry and cell biology.

This report elaborates the market size, market characteristics, and market growth of the Microcontact Printing industry, and breaks down according to the type, application, and consumption area of Microcontact Printing. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Microcontact Printing in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
