Abstracts

Microtome cryostat or freezing microtome is a medical device designed to obtain the cryo-sections of animal and plant tissue samples into thin sections (tissue are sectioned as thin as 1 micrometre). Microtome cryostat consists of a microtome contained within the refrigerated cabinet which is generally operated within the temperature range of -5°C to -50°C. Microtome cryostat is composed of an instrument to section the frozen tissue samples, a rotary microtome and knife or blade holder and a means to freeze the samples. Microtomes can be manual, semiautomatic and automatic.

This report elaborates the market size, market characteristics, and market growth of the Microtome Cryostat industry, and breaks down according to the type, application, and consumption area of Microtome Cryostat. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Microtome Cryostat in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
