Abstracts

Microturbines are generally small scale power generators that burn either gaseous or liquid fuel to produce electrical power. The burning of fuel creates high speed rotation of the turbine, which, in turn, rotates an electrical generator for power generation. These turbines are an essential part of distributed generation technology and are primarily used for on-site generation i.e. where the power generation and consumption happens mostly in the same place. These turbines also have great potential for CHP application, which increases their overall efficiency and provides numerous benefits to end-users.

This report elaborates the market size, market characteristics, and market growth of the Microturbine Systems industry, and breaks down according to the type, application, and consumption area of Microturbine Systems. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Microturbine Systems in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
