## **Abstracts**

The structural parts of the mobile phone include shell structural parts and internal structural parts. Shell structural parts can be divided into plastic structural parts and metal structural parts. The latter has a small market capacity due to interference with mobile phone signals, which is only about 1/10 of the overall market (according to sales estimates). The plastic structural parts are mainly made of plastic and paint-flavored raw materials (each accounting for about 25% of the cost) through the processes of mold making, injection molding, surface coating, vacuum coating, and other technological technologies.

The internal structural parts of the mobile phone include electromagnetic shielding parts, connectors, mobile phone slide rails, mobile phone antennas, and other subdivided products, mainly made of high-precision copper and high-precision stainless steel, and are made by process technology such as mold making and stamping. The common feature of both is that the precision of the mold is extremely high, reaching the micron level, which belongs to the real precision field in the manufacturing industry. This report elaborates the market size, market characteristics, and market growth of the Mobile Phone Structural Parts industry, and breaks down according to the type, application, and consumption area of Mobile Phone Structural Parts. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Mobile Phone Structural Parts in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
