## Abstracts

Nanoscale iron particles are sub-micrometer particles of iron metal. They are highly reactive because of their large surface area. In the presence of oxygen and water, they rapidly oxidize to form free iron ions. They are widely used in medical and laboratory applications and have also been studied for remediation of industrial sites contaminated with chlorinated organic compounds.

This report elaborates the market size, market characteristics, and market growth of the Nano-Iron industry, and breaks down according to the type, application, and consumption area of Nano-Iron. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Nano-Iron in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
