## Abstracts

Zeolites are microporous, aluminosilicate minerals commonly used as commercial adsorbents and catalysts.

Conventional open-pit mining techniques are used to mine natural zeolites. The overburden is removed to allow access to the ore. The ore may be blasted or stripped for processing by using tractors equipped with ripper blades and front-end loaders. In processing, the ore is crushed, dried, and milled. The milled ore may be air-classified as to particle size and shipped in bags or bulk. The crushed product may be screened to remove fine material when a granular product is required, and some pelletized products are produced from fine material.

This report elaborates the market size, market characteristics, and market growth of the Natural Zeolites industry, and breaks down according to the type, application, and consumption area of Natural Zeolites. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Natural Zeolites in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
