Abstracts

A lithium ion battery is a secondary battery (rechargeable battery) that mainly relies on lithium ions moving between a positive electrode and a negative electrode to operate. During charging and discharging, Li+ intercalates and deintercalates between the two electrodes: when charging, Li+ is deintercalated from the positive electrode, and the electrolyte is embedded in the negative electrode, and the negative electrode is in a lithium-rich state; The NWC lithium ion battery is a lithium ion battery using lithium nickel-manganese-cobalt oxide as the anode material.

This report elaborates the market size, market characteristics, and market growth of the NMC Lithium-Ion Batteries industry, and breaks down according to the type, application, and consumption area of NMC Lithium-Ion Batteries. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
