## Abstracts

A nuclear reactor is a device used to initiate and control sustained nuclear chain reactions. Nuclear reactors are deployed in nuclear power plants to generate electricity and for the propulsion of ships. Heat emitted from nuclear fission is passed to the working fluid, such as water or gas, to run the steam turbines. Nuclear reactors are deployed to generate isotopes utilized for medical & industrial purposes, and to produce weapons-grade plutonium. Some reactors are operated for research purposes only. The reactor internal pump is installed directly at the bottom of the nuclear reactor pressure vessel to provide cooling water to the reactor core.

This report elaborates the market size, market characteristics, and market growth of the NPP Pumps industry, and breaks down according to the type, application, and consumption area of NPP Pumps.
