Abstracts

A touch screen is a two-dimensional sensing device in the form of a transparent sheet, which is integrated on devices and provides a sensing and feedback system. It is a display screen that is sensitive to the touch of a finger or stylus. A touch screen consists of various layers that track and convert movements on the screen into electrical charge in the form of a signal. This signal is sent to the processor to perform the required action on the device. A touch screen requires three basic components to provide a touch interface: touch sensor, controller IC, and software driver. Of the three components, touch sensor holds high significance because it forms the interface between the display and user activities. Also, most of the R&D goes around touch sensors for enhancing the touch sensitivity. From smart phones to laptops to GPS systems, touchscreen devices are everywhere.

This report elaborates the market size, market characteristics, and market growth of the OGS Touch Screen industry, and breaks down according to the type, application, and consumption area of OGS Touch Screen.
