Abstracts

The term OLED is actually an acronym, and stands for organic light-emitting diode. For the unaware, a light-emitting diode is basically just a light source, and they're used widely in electronics.

But OLED is different because of the organic part. In an organic diode, there's a thin film of organic compound that emits light when you pass an electric current through it. So manufacturers take this organic semiconducting material and place it between two electrodes, which provide the current. Usually one of these electrodes is transparent, so the light that is being generated can escape – and be viewed by you.

These organic diodes – OLEDs, as it were – are used in bulk to create digital displays on a wide range of products, right the way from small wearable and smartphones, all the way up to huge, hulking television sets.

This report elaborates the market size, market characteristics, and market growth of the OLED Display Panel industry, and breaks down according to the type, application, and consumption area of OLED Display Panel. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for OLED Display Panel in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
