Abstracts

An oncolytic virus is a virus that preferentially infects and kills cancer cells. As the infected cancer cells are destroyed by oncolysis, they release new infectious virus particles or virions to help destroy the remaining tumour. Oncolytic viruses are thought not only to cause direct destruction of the tumour cells, but also to stimulate host anti-tumour immune responses.

This report elaborates the market size, market characteristics, and market growth of the Oncolytic Virus industry, and breaks down according to the type, application, and consumption area of Oncolytic Virus. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
