## Abstracts

Paraxylene, also known as PX or P-Xylene, is an aromatic hydrocarbon compound, derived particularly from benzene. Paraxylene is a colorless, toxic, sweet-smelling, and highly flammable chemical at room temperature. It is found naturally in petroleum and coal tar. Paraxylene or P-Xylene is an isomer of xylene compound, derived from benzene. Some of the other isomers of xylene include O-xylene and M-xylene. Paraxylene finds its largest application in large-scale manufacturing of terephthalic acid for polyester; also known as parylene. The production process of paraxylene is one of the most complicated among all the chemicals; simple crystallization of the xylene normally led to complex purification process owing to the formation of eutectic mixtures. It is manufactured by catalytic reforming of naphtha, a petroleum derivative, and separated in a series of adsorption or crystallization, distillation, and reaction processes from ethyl benzene, o-xylene, and m-xylene. The melting point of Paraxylene is highest among other isomers of xylene.

This report elaborates the market size, market characteristics, and market growth of the Paraxylene (Px) industry, and breaks down according to the type, application, and consumption area of Paraxylene (Px). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Paraxylene (Px) in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
