Abstracts

Particulate respirator is a respiratory protective device designed to achieve a very close facial fit and very efficient filtration of airborne particles. They are the simplest, least expensive, and least protective of the respirator types available. These respirators only protect against particles. They do not protect against chemicals, gases, or vapors, and are intended only for low hazard levels. The commonly known N-95 (N95 = NOT Resistant to solids and liquids which contain oil and provides 95% efficiency) filtering facepiece respirator is one type of particulate respirator, often used in hospital to protect against infectious agents. Particulate respirators are air-purifying respirators because they clean particles out of the air as you breathe. Even if you can't see the particles, there may be too many in the air for this respirator to provide adequate protection. This report elaborates the market size, market characteristics, and market growth of the Particulate Respirators industry, and breaks down according to the type, application, and consumption area of Particulate Respirators. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Particulate Respirators in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
