Abstracts

A passive optical network (PON) is a telecommunications technology used to provide fiber to the end consumer, both domestic and commercial. A PON's distinguishing feature is that it implements a point-to-multipoint architecture, in which unpowered fiber optic splitters are used to enable a single optical fiber to serve multiple end-points. The end-points are often individual customers, rather than commercial. A PON does not have to provision individual fibers between the hub and customer. Passive optical networks are often referred to as the 'last mile' between an ISP and customer. This report elaborates the market size, market characteristics, and market growth of the Passive Optical Network (PON) industry, and breaks down according to the type, application, and consumption area of Passive Optical Network (PON). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Passive Optical Network (PON) in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
