## Abstracts

Perfluoroalkoxy (PFA) are fluoropolymers. They are copolymers of tetrafluoroethylene (C<sub>2</sub>F<sub>4</sub>) and perfluoroethers (C<sub>2</sub>F<sub>3</sub>OR<sub>f</sub>, where R<sub>f</sub> is a perfluorinated group such as trifluoromethyl (CF<sub>3</sub>)). In terms of their properties, these polymers are similar to polytetrafluoroethylene (PTFE). The big difference is that the alkoxy substituents allow the polymer to be melt-processed. On a molecular level, PFA has a smaller chain length and higher chain entanglement than other fluoropolymers. It also contains an oxygen atom at the branches. This results in a material that is more translucent and has improved flow, creep resistance, and thermal stability close to or exceeding PTFE. Similarly advantaged processing properties are found in fluorinated ethylene propylene (FEP), the copolymer of tetrafluoroethylene and hexafluoropropylene.

This report elaborates the market size, market characteristics, and market growth of the Perfluoroalkoxy (PFA) industry, and breaks down according to the type, application, and consumption area of Perfluoroalkoxy (PFA). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Perfluoroalkoxy (PFA) in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
