Abstracts

A glass electrode is perhaps the most successful and ubiquitous electrochemical sensor. It provides information about the activity of hydronium ions, H_3O^+ , in water. Because water, which mildly dissociates to H_3O^+ and OH^- ions, is the most common solvent medium, and chemical reactions in water largely depend on H_3O^+ activity, the ability to measure it is essential. And conversely, because H_3O^+ activity, or rather, its negative logarithm, the pH, is so easy to measure, pH is the most commonly monitored and recorded parameter of liquid samples.

This report elaborates the market size, market characteristics, and market growth of the PH Electrochemical Electrodes industry, and breaks down according to the type, application, and consumption area of PH Electrochemical Electrodes. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for PH Electrochemical Electrodes in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
