Abstracts

Phenylketonuria is a rare genetic condition that leads to the production of phenylalanine in the body. Phenylalanine is an amino acid present in all proteins and in certain artificial sweeteners. The human body uses enzyme phenylalanine hydroxylase to convert phenylalanine into tyrosine, which is a nonessential amino acid. The human body requires tyrosine to create neurotransmitters, such as epinephrine, norepinephrine, and dopamine.

Phenylketonuria (PKU) is caused due a defect in the gene which helps to produce phenylalanine hydroxylase. Absence of phenylalanine hydroxylase leads to a buildup of phenylalanine in the body. Timely diagnosis and treatment helps in terminating the symptoms of PKU and avoid brain damage. Phenylketonuria is an inherited genetic condition caused due to a defect in the PAH gene. The PAH gene is responsible for the production of phenylalanine hydroxylase for breakdown of phenylalanine. Increased levels of phenylalanine can occur due to high intake of protein, such as eggs and meat. For an infant to inherit phenylketonuria, both parents must pass on a defective version of the PAH gene.

This report elaborates the market size, market characteristics, and market growth of the Phenylketonuria (PKU) industry, and breaks down according to the type, application, and consumption area of Phenylketonuria (PKU). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Phenylketonuria (PKU) in a special period. This chapter also compares the markets of
