Abstracts

Photochromic lenses are optical lenses that darken on exposure to specific types of light of sufficient intensity, typically ultraviolet (UV) radiation. Photochromic lenses can be made of glass, polycarbonate, or another plastic. They are principally used in eyeglasses that are dark in bright sunlight, but clear in low ambient light conditions. They darken significantly within about a minute of exposure to bright light, and take somewhat longer to clear. A range of clear and dark transmittances are available. This report elaborates the market size, market characteristics, and market growth of the Photochromic Lenses industry, and breaks down according to the type, application, and consumption area of Photochromic Lenses. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Photochromic Lenses in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
