Abstracts

Photoresist is an organic polymer that changes its chemical structure when exposed to ultraviolet light. There are two types of photoresists, positive and negative. When exposed to UV light, the positive photoresist becomes soluble, while when exposed to UV light, the negative photoresist becomes crosslinked and insoluble. Photoresist aids are related products used with photoresists.

This report elaborates the market size, market characteristics, and market growth of the Photoresists and Ancillaries industry, and breaks down according to the type, application, and consumption area of Photoresists and Ancillaries. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Photoresists and Ancillaries in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
