Abstracts

It is a special type of bearing specially applied to electric motors or motors. The bearing used in the motor is a part that supports the shaft. It can guide the rotation of the shaft and can also withstand the components that are idle on the shaft. The concept of the bearing is very broad. There are four types of bearings commonly used in motors, namely rolling bearings, plain bearings, joint bearings and oil-impregnated bearings. The most common motor bearings are rolling bearings, bearings with rolling elements. A plain bearing refers to a bearing without a rolling element, that is, a bearing for sliding motion.
This report elaborates the market size, market characteristics, and market growth of the Plain Bearings Motors industry, and breaks down according to the type, application, and consumption area of Plain Bearings Motors. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Plain Bearings Motors in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
