Abstracts

Plasma Nitriding known also as ion nitriding is a form of case hardening process. It is a heat treatment process which diffuses nitrogen into the surface of a metal to create a case-hardened surface.

Plasma nitriding uses plasma discharge physic to diffuse nitrogen into the surface of a ferrous alloy.

The plasma nitriding process starts by pumping the atmosphere of the furnace chamber until the desired vacuum pressure. Then a gas mixture typically made of nitrogen and hydrogen is introduced into the chamber. A voltage difference is applied between the wall of the furnace and the parts. Due to this difference of potential and to the low pressure the gas is ionized. Ion bombardment will have the double effect of cleaning the parts and also increase the temperature up to the nitriding temperature generally between 500 and 580°C.

This report elaborates the market size, market characteristics, and market growth of the Plasma Nitriding Furnace industry, and breaks down according to the type, application, and consumption area of Plasma Nitriding Furnace. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Plasma Nitriding Furnace in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
