Abstracts

Point-of-care testing (POCT) may be defined as the rapid specific testing of bodily fluids at the bedside.

Owing to the relatively long turnaround time of conventional laboratory tests, and with the aim of reducing inappropriate transfusion, there is increasing interest in point-of-care coagulation testing (POCCT) which can provide results within minutes. In addition, the wide acceptance of the current cell-based model of coagulation has led to an emphasis on the pivotal role of platelets and particular interest in devices testing whole blood, rather than plasma used in laboratory-based tests. The latter include the prothrombin time (PT) and activated partial thromboplastin time (aPTT) which provide information on the first phase of coagulation up to fibrin formation. Conversely, viscoelastic POCCT devices produce information on all phases of coagulation, providing insight into interactions between the cellular and plasma components of whole blood and the activity of the fibrinolytic system; all of which are vital for successful haemostasis.

This report elaborates the market size, market characteristics, and market growth of the Point-Of-Care Coagulation Testing Devices industry, and breaks down according to the type, application, and consumption area of Point-Of-Care Coagulation Testing Devices. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Point-Of-Care Coagulation Testing Devices in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
