Abstracts

PCWs are a specialist fiber with limited applications when temperatures of over 2300F are encountered and RCF will not work. PCWs are made predominantly of aluminum (content typically 72-99% in the form of oxide) with the remainder consisting of silicon. The fibers are manufactured by sol-gel technology using gel extrusion, spinning and/or drawing in controlled air streams, using equipment/processes specifically designed to produce fibers of defined dimensions. These are then subjected to high-temperature treatment to produce the required polycrystalline structure.

This report elaborates the market size, market characteristics, and market growth of the Polycrystalline Fiber industry, and breaks down according to the type, application, and consumption area of Polycrystalline Fiber. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Polycrystalline Fiber in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
