Abstracts

Polydimethylsiloxane (PDMS) is the simplest member of the silicone polymer family. It is formed by hydrolyzing Me_2SiCl_2 , which is produced from high-purity SiO_2 and CH_2Cl_2 by the Muller–Rochow reaction. The term “silicone” was coined by chemist F. S. Kipping in 1901.

Low–molecular weight PDMS is a liquid used in lubricants, antifoaming agents, and hydraulic fluids. Its use in breast implants is not as popular as it once was because of safety concerns.

At higher molecular weights, PDMS is a soft, compliant rubber or resin. It is used in caulks, sealants, an even Silly Putty. More recently, PDMS resins have been used in soft lithography, a key process in biomedical microelectromechanical systems (bio-MEMS).

This report elaborates the market size, market characteristics, and market growth of the Polydimethylsiloxane (PDMS) industry, and breaks down according to the type, application, and consumption area of Polydimethylsiloxane (PDMS). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Polydimethylsiloxane (PDMS) in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
