Abstracts

Film capacitors use a thin plastic film as the dielectric. The film of the capacitor is made very thin, usually through a complex film drawing process, with a thickness of less than 1 μ m. Once manufactured, the film is either metallized or left untreated depending on the application. The structure is further completed by the addition of electrodes, after which the entire assembly is mounted into the housing to prevent certain environmental factors. Film capacitors are not polarized and are therefore highly preferred for use in AC signals and power supplies.

This report elaborates the market size, market characteristics, and market growth of the Power Film Capacitors industry, and breaks down according to the type, application, and consumption area of Power Film Capacitors. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Power Film Capacitors in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
