Abstracts

Power resistors are designed to withstand and dissipate large amounts of power. Typically, they are rated for at least 5 watts. They are made of a material with high thermal conductivity and can be effectively cooled. They are usually designed to couple with a heat sink to dissipate a lot of power. At maximum load, some may even require forced air or liquid cooling. Some are wound and some are made of wire grids to facilitate cooling, but all power resistors have in common that they are constructed to dissipate maximum power while keeping their size as small as possible.

This report elaborates the market size, market characteristics, and market growth of the Power Resistors industry, and breaks down according to the type, application, and consumption area of Power Resistors. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Power Resistors in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
