Abstracts

A progressive cavity pump is a type of positive displacement pump and is also known as a progressing cavity pump, progg cavity pump, eccentric screw pump or cavity pump. It transfers fluid by means of the progress, through the pump, of a sequence of small, fixed shape, discrete cavities, as its rotor is turned. This leads to the volumetric flow rate being proportional to the rotation rate (bidirectionally) and to low levels of shearing being applied to the pumped fluid.

This report elaborates the market size, market characteristics, and market growth of the Progressing Cavity Pump industry, and breaks down according to the type, application, and consumption area of Progressing Cavity Pump. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Progressing Cavity Pump in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
