Abstracts

PVC stabilizers prevent the initial elimination of hydrogen chloride in PVC. Since PVC is softened by heating during extrusion or molding, it is necessary to prevent the elimination of hydrogen chloride due to heating and subsequent decomposition. When the PVC is heated to 170-180 ° C, chlorine and hydrogen in the molecule are eliminated, and the release of hydrogen chloride becomes apparent. Once this decomposition begins, an unstable structure is formed in the molecule, which further accelerates the elimination and decomposition of HCl.

This report elaborates the market size, market characteristics, and market growth of the PVC Stabilizer industry, and breaks down according to the type, application, and consumption area of PVC Stabilizer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for PVC Stabilizer in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
